- HW 7 due Sun 3/27 11:59pm EST

Recap: Decidability of Regular and CFLs

- $A_{\text{DFA}} = \{\langle B, w \rangle \mid B \text{ is a DFA that accepts input string } w\}$ Decidable
- $A_{\text{NFA}} = \{\langle B, w \rangle \mid B \text{ is an NFA that accepts input string } w\}$ Decidable
- $A_{\text{REX}} = \{\langle R, w \rangle \mid R \text{ is a regular expression that generates string } w\}$ Decidable
- $E_{\text{DFA}} = \{\langle A \rangle \mid A \text{ is a DFA and } L(A) = \emptyset\}$ Decidable
- $EQ_{\text{DFA}} = \{\langle A, B \rangle \mid A \text{ and } B \text{ are DFAs and } L(A) = L(B)\}$ Decidable
- $A_{\text{CFG}} = \{\langle G, w \rangle \mid G \text{ is a CFG that generates string } w\}$ Decidable
- $E_{\text{CFG}} = \{\langle G \rangle \mid G \text{ is a CFG and } L(G) = \emptyset\}$ Decidable
- $EQ_{\text{CFG}} = \{\langle G, H \rangle \mid G \text{ and } H \text{ are CFGs and } L(G) = L(H)\}$ Undecidable?
- $A_{\text{TM}} = \{\langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w\}$ Undecidable?⁷⁹

Thm: A_{TM} is Turing-recognizable

$$A_{\text{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w \}$$

U = “On input $\langle M, w \rangle$, where M is a TM and w is a string:

1. Simulate M on input w .
2. If M ever enters its accept state, *accept*; if M ever enters its reject state, *reject*.”

U = Extended δ “run” function for TMs

- Computer that can simulate other computers
- i.e., “The Universal Turing Machine”
- Problem: U loops when M loops

So it's a recognizer, not a decider

Thm: A_{TM} is undecidable

$$A_{\text{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w \}$$

- ???

next →

It's hard to prove that something is not true!

Typically need complicated proof techniques

e.g., pumping lemma and proof by contradiction for proving non-regularness

Kinds of Functions (a fn maps DOMAIN \rightarrow RANGE)

- **Injective**, a.k.a., “one-to-one”
 - Every element in DOMAIN has a unique mapping
 - How to remember:
 - Entire DOMAIN is mapped “in” to the RANGE
- **Surjective**, a.k.a., “onto”
 - Every element in RANGE is mapped to
 - How to remember:
 - “Sur” = “over” (eg, survey); DOMAIN is mapped “over” the RANGE
- **Bijective**, a.k.a., “correspondence” or “one-to-one correspondence”
 - Is both injective and surjective
 - Unique pairing of every element in DOMAIN and RANGE

Countability

- A set is “**countable**” if it is:
 - Finite
 - Or, there exists a **bijection** between the set and the natural numbers
 - In this case, the set has the same size as the set of natural numbers
 - This is called “**countably infinite**”

Exercise: Which set is larger?

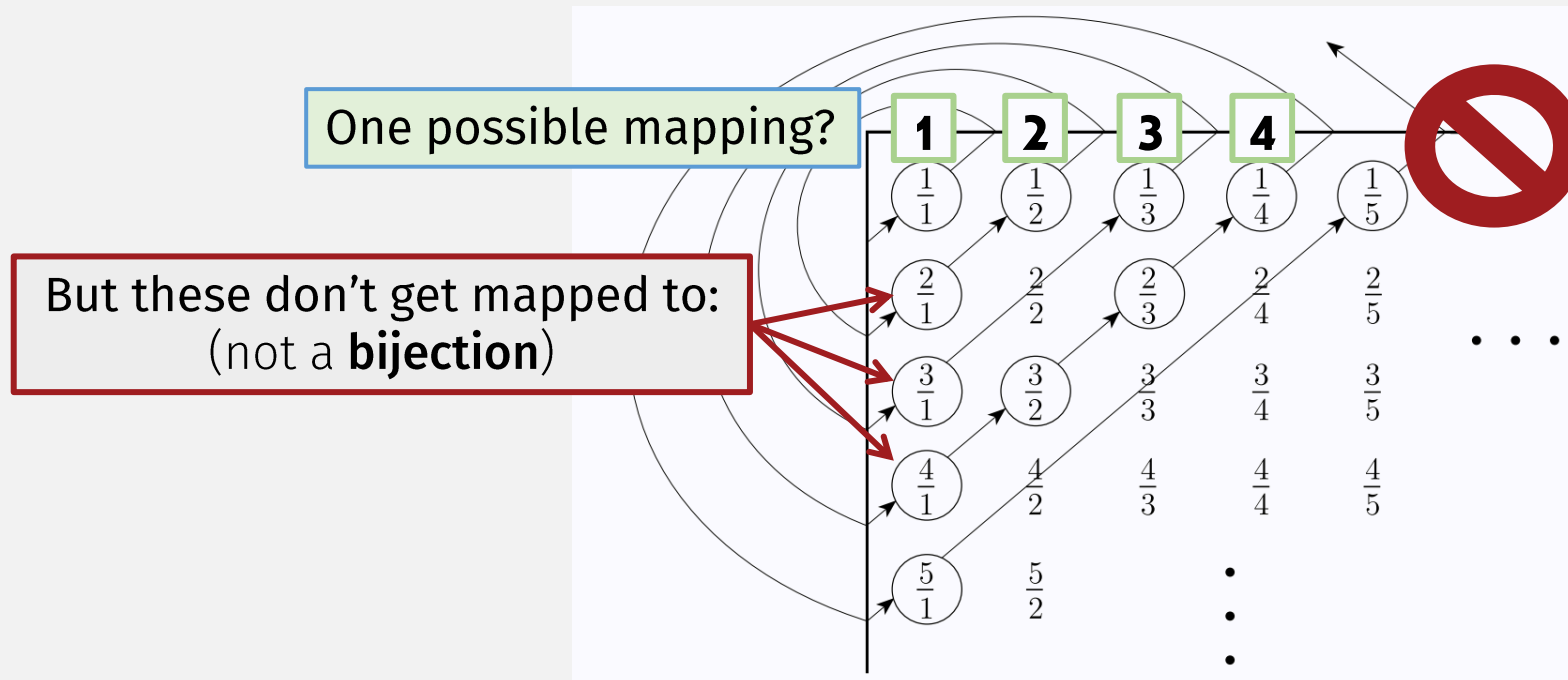

- The set of:
 - Natural numbers, or
 - Even numbers?
- They are the same size! Both are **countably infinite**
 - Proof: Bijection:

n	$f(n) = 2n$
1	2
2	4
3	6
\vdots	\vdots

Every natural number maps to a unique even number, and vice versa

Exercise: Which set is larger?

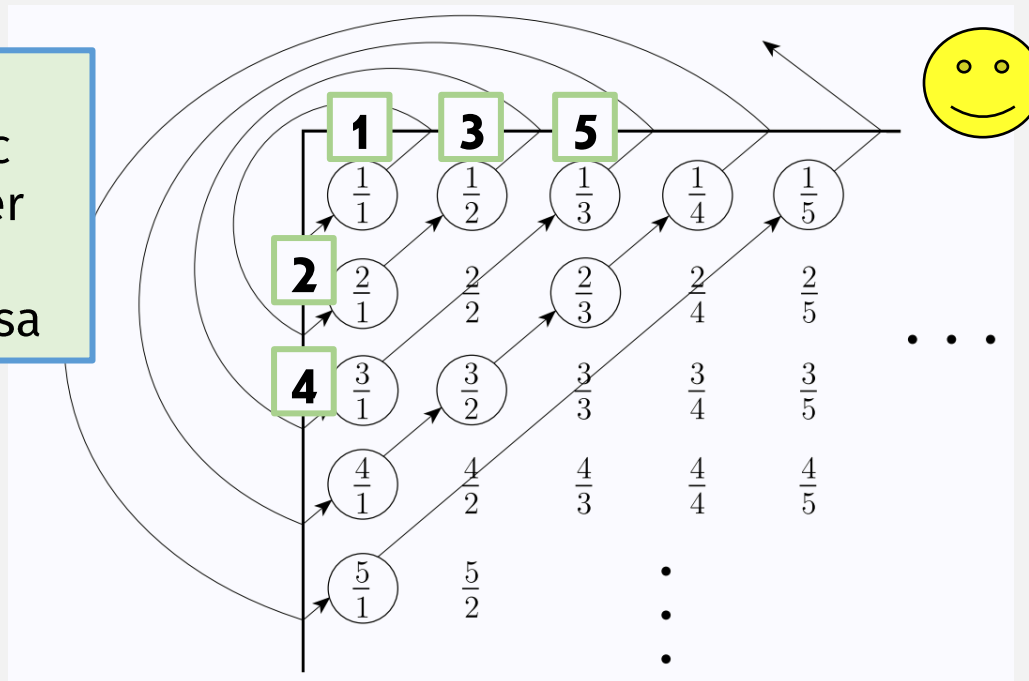

- The set of:
 - Natural numbers \mathcal{N} , or
 - Positive rational numbers? $\mathcal{Q} = \left\{ \frac{m}{n} \mid m, n \in \mathcal{N} \right\}$
- They are the same size! Both are **countably infinite**

Exercise: Which set is larger?

- The set of:
 - Natural numbers \mathcal{N} , or
 - Positive rational numbers? $\mathcal{Q} = \left\{ \frac{m}{n} \mid m, n \in \mathcal{N} \right\}$
- They are the same size! Both are **countably infinite**

Another mapping:
This is a **bijection** bc
every natural number
maps to a unique
fraction, and vice versa

Exercise: Which set is larger?

- The set of:
 - Natural numbers, or \mathcal{N}
 - Real numbers? \mathcal{R}
- There are more real numbers. It is **uncountably infinite**.

Proof, by contradiction:

- Assume a bijection between natural and real numbers exists.

• This means: every nat num maps to a unique real, and vice versa

But we show that in any given mapping,

- Some real number is not mapped to ...
- E.g., a number that has different digits at each position:

$$x = 0.4641 \dots$$

- This number cannot be included in mapping ...
- ... So we have a contradiction!

This is called
“diagonalization”

n	$f(n)$
1	3.14159 ...
2	55.55555 ...
3	0.12345 ...
4	0.50000 ...
\vdots	\vdots

Georg Cantor

- Invented set theory
- Came up with **countable infinity** (1873)
- **And uncountability:**
 - Also: how to show uncountability with “**diagonalization**” technique

A formative day for Georg Cantor.

Diagonalization with Turing Machines

Diagonal: Result of Giving a TM its own Encoding as Input

All TM Encodings

	$\langle M_1 \rangle$	$\langle M_2 \rangle$	$\langle M_3 \rangle$	$\langle M_4 \rangle$...	$\langle D \rangle$...
M_1	<u>accept</u>	reject	accept	reject		accept	
M_2	accept	<u>accept</u>	accept	accept	...	accept	...
M_3	reject	reject	<u>reject</u>	reject		reject	
M_4	accept	accept	reject	<u>reject</u>		accept	
\vdots			\vdots		\ddots		
D	reject	reject	accept	accept		<u>?</u>	
\vdots							

opposites

All TMs

Try to construct "opposite" TM D

TM D can't exist!

It must both accept and reject!

What should happen here?

Thm: A_{TM} is undecidable

$$A_{\text{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w \}$$

Proof by contradiction:

1. Assume A_{TM} is decidable. Then there exists a decider H :

$$H(\langle M, w \rangle) = \begin{cases} \text{accept} & \text{if } M \text{ accepts } w \\ \text{reject} & \text{if } M \text{ does not accept } w \end{cases}$$

2. If H exists, then we can create the “opposite” machine:

$D =$ “On input $\langle M \rangle$, where M is a TM:

From the
previous
slide

1. Run H on input $\langle M, \langle M \rangle \rangle$.

Result of giving a TM itself as input

2. Output the opposite of what H outputs. That is, if H accepts,

reject; and if H rejects, *accept*.”

Do the opposite

Thm: A_{TM} is undecidable

$$A_{\text{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w \}$$

Proof by contradiction:

This cannot be true

1. Assume A_{TM} is decidable. Then there exists a decider H :

$$H(\langle M, w \rangle) = \begin{cases} \text{accept} & \text{if } M \text{ accepts } w \\ \text{reject} & \text{if } M \text{ does not accept } w \end{cases}$$

2. If H exists, then we can create an “opposite” machine:

$D =$ “On input $\langle M \rangle$, where M is a TM:

1. Run H on input $\langle M, \langle M \rangle \rangle$.
2. Output the opposite of what H outputs. That is, if H accepts, *reject*; and if H rejects, *accept*.”

From the
previous
slide

3. But D does not exist! Contradiction! So assumption is false.

Easier Undecidability Proofs

- We proved $A_{\text{TM}} = \{\langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w\}$ undecidable ...
- ... by contradiction:
- By showing its decider can help create impossible decider “ D ”!
- Coming up with “ D ” was hard (needed to invent diagonalization)
- But then we more easily reduced A_{TM} to “ D ”
- Easier: **reduce** problems to A_{TM} !

	$\langle M_1 \rangle$	$\langle M_2 \rangle$	$\langle M_3 \rangle$	$\langle M_4 \rangle$	\dots	$\langle D \rangle$
M_1	<u>accept</u>	reject	accept	reject		accept
M_2	accept	<u>accept</u>	accept	accept	\dots	accept
M_3	reject	reject	<u>reject</u>	reject		reject
M_4	accept	accept	reject	<u>reject</u>		accept
\vdots			\vdots		\ddots	
D	reject	reject	accept	accept		<u>?</u>

i.e., “Algorithm to determine if a TM is an decider”?

The Halting Problem

$$HALT_{TM} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$$

Thm: $HALT_{TM}$ is undecidable

Proof, by contradiction:

- Assume $HALT_{TM}$ has decider R ; use it to create decider for A_{TM} :

- ...

- But A_{TM} is undecidable and has no decider!

contradiction

What if Alan Turing had been an engineer?

The Halting Problem

$$HALT_{TM} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$$

Thm: $HALT_{TM}$ is undecidable

Proof, by contradiction:

Using our hypothetical decider R

- Assume $HALT_{TM}$ has decider R ; use it to create decider for A_{TM} :

$S =$ “On input $\langle M, w \rangle$, an encoding of a TM M and a string w :

1. Run TM R on input $\langle M, w \rangle$.

2. If R rejects, *reject*. ← This means M loops on input w

3. If R accepts, simulate M on w until it halts. ← This step always halts

4. If M has accepted, *accept*; if M has rejected, *reject*.”

Termination argument:

Step 1: R is a decider so always halts

Step 3: M always halts bc R said so

The Halting Problem

$$HALT_{TM} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$$

Thm: $HALT_{TM}$ is undecidable

Proof, by contradiction:

- Assume $HALT_{TM}$ has decider R ; use it to create decider for A_{TM} :

~~$S =$ “On input $\langle M, w \rangle$, an encoding of a TM M and a string w :~~

- ~~1. Run TM R on input $\langle M, w \rangle$.~~
- ~~2. If R rejects, *reject*.~~
- ~~3. If R accepts, simulate M on w until it halts.~~
- ~~4. If M has accepted, *accept*; if M has rejected, *reject*.”~~

- But A_{TM} is undecidable!
 - I.e., this decider that we just created cannot exist! So $HALT_{TM}$ is undecidable

Easier Undecidability Proofs

In general, to prove the undecidability of a language:

- Use proof by contradiction:

1. Assume the language is decidable,

2. Show that its decider can be used to create a decider for ...

- ... a known undecidable language ...

3. ... which doesn't have a decider! Contradiction!

Summary: The Limits of Algorithms

- $A_{\text{DFA}} = \{\langle B, w \rangle \mid B \text{ is a DFA that accepts input string } w\}$ Decidable
- $A_{\text{CFG}} = \{\langle G, w \rangle \mid G \text{ is a CFG that generates string } w\}$ Decidable
- $A_{\text{TM}} = \{\langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w\}$ **Undecidable**
- $E_{\text{DFA}} = \{\langle A \rangle \mid A \text{ is a DFA and } L(A) = \emptyset\}$ Decidable
- $E_{\text{CFG}} = \{\langle G \rangle \mid G \text{ is a CFG and } L(G) = \emptyset\}$ Decidable
- $E_{\text{TM}} = \{\langle M \rangle \mid M \text{ is a TM and } L(M) = \emptyset\}$ **Undecidable**
